PROJECT REPORT

Title: Smart AI Helpdesk System

1. Introduction

The Smart AI Helpdesk System is designed to automate customer support using Artificial Intelligence. It helps in responding to user queries quickly and efficiently without human intervention. This system improves productivity and reduces workload.

2. Objective

To automate customer support services

To reduce response time

To improve user satisfaction

To implement basic AI-based response system

3. Technologies Used

Python

Natural Language Processing (NLP)

Machine Learning (basic logic)

4. System Description

The system takes user input in the form of text queries. It processes the query using AI logic and generates a suitable response. The system can also detect important keywords and prioritize urgent queries.

5. Features

Automated response generation

Keyword-based query handling

Priority detection (urgent queries handled faster)

Easy to extend and modify

6. Improvements Made

Modified response generation logic

Added priority detection feature

Improved code readability

Structured project documentation

7. Future Scope

Integration with chatbot interface

Real-time API deployment

Advanced AI models for better accuracy

8. Conclusion

The Smart AI Helpdesk System helps in automating support tasks efficiently. It reduces manual effort and provides quick responses, making it useful for modern applications.
